

ITCN's new BCIT is available as a rugged or semi-rugged portable toolset that troubleshoots MIL-STD-1553 bus networks and locates cabling faults to within 6 inches. It also aids in identifying faulty LRUs that do not participate in bus communications properly by monitoring bus health and performance.

Two critical maintenance tools in one make the BCIT ideal for flightline use.

Contact ITCN for more information about BCIT and get your **FREE Guide to Synchronized Instrumentation**
